Usage Handbook

Civic Operations · Team MANTIS · what each person can do, screen by screen

Civic Operations helps a city handle non emergency problems, such as potholes, broken street lights or noise, from the moment a resident reports one until a crew fixes it. Twelve reasoning components make suggestions and explain them. People stay in charge. This handbook covers the four kinds of user. The app must be running first: see the Setup Guide.

Who	How to get in	Main screens
Resident	Home page, register with any email, keep the user ID shown	Report, Track
City staff	Footer link, staff ID and PIN	Queue, Crew routes, Admin questions, Busy day alerts
Crew	Footer link, crew ID and PIN	Today's stops
Tech team	Footer link, tech ID and PIN	Components, Measurements, Accounts, System
Anyone	Features in the top menu	What the product does

Residents

Register

On the home page click **Yes, report it**. Enter any email and click **Create my user ID**. You get an ID such as NYC-ABCD-1234. Write it down: next time you sign in with it. Only a scrambled fingerprint of your email is kept.

Report a problem

- **Pick it.** Choose the kind of problem from a few clear choices, then the place and the details.
- **Or just tell us.** Type it in your own words, for example: there is a deep pothole on Atlantic Avenue near 4th Avenue in Brooklyn. The bot reads the problem, the address and the time, and asks only for what is missing.

> **If someone may be in danger**, the app stops with a full screen message to call 911. Nothing is filed and your words are not kept. That is on purpose: 311 is not for emergencies.

Track it

After sending you see a reference such as CO-551A4B and a line of stations, like a subway map, that light up as your report moves on. Ask the status bot questions such as where is my request. If the problem is still there after it was closed, say so and it comes back with more attention.

City staff

The queue

Every open request, ranked. Each card says why it is where it is, for example high urgency, official deadline 48 h, near a school. Click the numbers at the top to filter. Zoom the map to a borough with the buttons above it: the real streets appear. Click a dot or a card to open the request.

A request

- **Overview.** Agency, status, the reporter's record (never their identity), and the map.

- **Why, step by step.** What each component decided, and why.
- **Notes.** Notes for other staff.
- **Your decisions.** Approve an escalation, or confirm that a nearby school or hospital is affected. These count in the ranking only once you approve them.
- **Crew.** See which crew has it, give it to another crew, or **Pull back** to take it off its crew.

Crew routes

Crew deployment plans every crew's day and sends each route to its crew automatically. Open a crew to see its route on a street map: the black square is its depot, the green dot is where it is now, and the numbers are its stops in order. **Pull back** removes a job from the crew. A pulled back job waits for a person and is never sent again by itself. If the tech team switches Crew deployment off, nothing is sent automatically and you assign crews from each request.

Admin questions and busy day alerts

Ask the queue a question in plain English, for example how many open requests are in Brooklyn. It only reads, it never changes anything. Busy day alerts show which kinds of report are expected to rise on a day, from the weather.

Crews

After signing in you see today's stops in order, on a street map that starts at your depot. Open a stop, then choose what you found: fixed, cleared before you arrived, nothing found, no access, or another agency's job. Confirm, and the stop is ticked, your position on the map moves there, and the resident sees the result.

Tech team

- **Components.** Every component's health, with one switch each. Switched off, a component gives its safe default and the app keeps working. Staff are told.
- **Measurements.** Run the switch off measurement: what each component changes in the queue.
- **Accounts.** Create staff, crew and tech accounts. A PIN is shown once. Give a new PIN or turn an account off.
- **System.** How each component was chosen: methods compared, runs, and what shipped.

Common questions and problems

Question or problem	Answer
I lost my resident user ID	Register again with the same email: the app says it is already registered but never shows the ID, for privacy. Register with another email to continue.
My report did not go through and I saw a STOP screen	The Emergency check thought someone may be in danger. If nobody is, click I am safe, go back, and describe it again without words such as collapsed or fire.
The bot asks again for the address	It could not find a New York address. Give a number and street, or two crossing streets, and the borough.
A crew sees no stops	No route has been sent to that crew yet, Crew deployment is switched off, or staff pulled the jobs back. Wait a minute and reload.
A request I expected is not in Crew routes	It may be waiting for review, held as a duplicate, or there is no crew with the skill and time left today. The bottom of Crew routes lists why.
Staff sign in says locked	Five wrong PINs lock an ID for 15 minutes. Ask the tech team for a new PIN.
The page shows Cannot reach the server	The app is still starting or was stopped. Wait a minute and reload, or see the Setup Guide.
Numbers and positions differ from a colleague's	They depend on the time of day and on what was filed since. That is expected.
